GROW BETTER LAWNS with BETTER SEEDS

For a finer, smoother lawn, use Wyatt's tested lawn grass mixtures. Listed on the next page we offer mixtures that have been found, in actual field tests, to be the best mixtures for this section of the country. Select the mixture that suits your soil and conditions best and you will have taken the most important step in the production of a fine lawn. A good lawn requires constant care so read what we have to say on the next page on "How to Build a Lawn" or write us giving full particulars concerning soil, sun, shade, trees, etc.

How to make a beautiful lawn

The first requisite for a lawn of any kind, be it permanent or merely temporary, is good soil. Good soil from a point of plant growth must have these three vital parts: Plant food, moisture, and humus. Most of us are familiar with the first two of these but some of us are not so familiar with the third—humus. Humus is that part of an ideal soil that renders it porous and loamy. It prevents heavy soils from pooking or baking and adds lodi to light or sandy soils, thereby increasing their moisture-holding capacity. Sorely, since plant foods must be in a liquid form before they are available to plants, humus is the most important of the three vital parts of an ideal soil. Heavy soils without humus are so tightly packed that they have no room for moisture. Loamy or light soils at having a capacity for more moisture, or rapidy they become very dry too often for healthy plant growth. And lastly, we will see then that humus added to heavy soil increases its capacity of moisture retention, preventing its pooking or baking and when added to sandy or light soil increases its ability to retain moisture.

VEGETABLE PLANTING CALENDAR

The chart below lists the more popular vegetables showing approximate dates, space for sowing, depth, etc. The dates for sowing and maturing would, of course, vary with the locality and the depth for sowing varies with soil consistency. The chart should be used as a general guide. We invite correspondence at all times relative to gardening or farming activities and are always glad to furnish any information that may be in our possession.

GARDEN for DEFENSE

It's difficult for us in this land of plenty to become concerned about food shortages—but fresh vegetables and other food crops, will in all probability be scarce and higher during the next few seasons.

At the outset we have to consider the generally short food crops of last season, owing to drought, following which we have the increased demand in the regular markets for all farm products that will be brought on by tremendous governmental expenditures for defense. Add to this the enormous consumption of a daily expanding military camp in almost every community and it seems to us the logical answer to those who want fresh vegetables for health and economy is a VEGETABLE GARDEN.

Aside from the usual advantages in health and economy derived from gardening you will have lightened the burden of transportation and manpower so much needed during the next few months for our defense program.

To begin with—select WYATT'S TESTED SEEDS from this catalog or ask for them at your nearest seed dealers.
27 Bush Bean, Plentiful - Bronze Medal winner in the 1933 All-America selections. PLentiful is a green, flat-podded bush bean—an improved and very productive variety of the Beautiful type. CULTURE: The Melon delights in warm rich soil with perfect drainage, and can never be grown to perfection under unfavorable conditions. Very good Melons, however, can be grown on almost any land if the trouble is taken to dig holes 2 feet square, filling them with a rich compost of woods-mold and cow-pen manure. Plant three-fourths to one inch deep from April to June with rows 6 feet apart, leaving not less than 4 feet between the hills, putting about 10 seeds to the hill. As insects are often very destructive, it is best not to thin all until the plants are well started. When they are large enough to be thin, thin to one plant to a hill, and keep the ground mellow and free from weeds. Those who make a speciality of Muskmelons will find it advantageous to start the seed under protection of glass, or as to have the plants ready by the time seeds could be usually planted in the open ground.

In Cultivation Before the Christian Era, Herbs Form the Most Fascinating Group of Subjects in Modern Gardening*

For all broad interest most gardeners will admit that the versatility of the aromatic herbs make this group of plants among the most fascinating that can be grown in America. Herbs will furnish food, flavoring, medicine, fragrance in the garden and in the home, besides their beauty as garden subjects and cut flowers. Herbs thrive in most soils and should be sown early in the spring. Thin out to about one foot apart. Those grown for foliage should be cut before they come into full bloom and hung in bunches or spread thinly where they can dry quickly.

This fascinating study, one that was practiced so diligently thousands of years ago—Herb gardening—is once more coming into popularity. Be the first to have a complete herb garden in your neighborhood. Our stock of herb seeds is one of the most complete in America.

**2198 Zinnia, Super Crown O’Gold Pastel Tints**

The flowers are large and showy, combining the ruggedness of the Dahlia Flowered with the soft effect of the California Giants. It is strictly a mixture of pastel tints containing a wide range of pastel shades. Delightly soft, yet colorful for garden decoration, it is unexcelled for cutting. The plants are strong and robust and the flowers are borne profusely through the season. Pkt. 10c; ½ oz. 50c.

**2245 Zinnia, Wildfire**

The fantasy type of Zinnia with its friendly informality is certainly maintaining its place as a reigning favorite in the Zinnia family. WILDFIRE adds a distinct note of cheerfulness to the garden and will enliven any home when used in flower arrangements. The plants are neat in habit, strong growing and very free blooming 2½ to 3 feet in height and come into flower 45 to 50 days after the seeds are sown. In growing this or any other zinnia we strongly recommend sowing the seeds where the plants are to bloom if it is at all possible. WILDFIRE is a rich dashing scarlet, a truly beautiful flower possessing a color and texture rarely found except in zinnias. Pkt. 10c; 3 pkts. 25c.

**2247 Zinnia, Star Dust**

Another brilliant member of the popular Fantasy group, STAR DUST received the Award of Merit in the 1937 All-America Selections. This lovely golden yellow variety has the characteristic informal, shaggy-petaled, medium-sized flowers on stems of good length for cutting. Plants are 2½ to 3 feet high, bloom in 45 to 50 days. Pkt. 10c; 3 pkts. 25c.

**2046 Scabiosa, Blue Moon**

Of this complete doubleness the flowers are extremely rich. The color is deep, rich lavender blue. The plants grow 3 to 4 feet. BLUE MOON received Honorable Mention in the 1939 All-America Selections. Pkt. 10c; 3 pkts. 25c.

1787 MACHER. A very choice large flowered type. Pkt. 10c; ¼ oz. 15c.

IPOMEAS. In growing Ipomeas (Morning Glories and Moonflowers), never plant until the soil is thoroughly warm. To aid germination of particularly hard seeded varieties, filling a small ditch at the top of the seed will help considerably. Always select the driest, sandiest part of the garden and sow where the plants are to flower as the Ipomeas resent transplanting. Plants should be kept on the dry side in order to induce early and abundant flowering with a rather sparse growth of foliage. Heavy watering will stimulate foliage growth at the expense of flowers. A poor soil is preferable to a rich one and fertilizer should not be used as this will promote heavy foliage which will hide the flowers.

PETUNIAS

Sow the small seeds in a warm, sunny, open place outdoors, thinning to 15 inches apart, or in frames for transplanting. Scatter seeds thinly, barely cover and firm soil over them; water seedlings with a fine spray to prevent drying out. The weakest looking seedlings usually produce the finest flowers, so save the weak plants for transplanting. Seed of the double and fringed sorts should be pressed into a shallow pot of sifted soil and covered with only a sprinkling of sand. The pot should be watered from below by placing it in water. Never allow to become too dry nor too moist.

The plants are neat in habit, and very free blooming. 2' to 3 ft. in height and come into flower 45 to 50 days after the seeds are sown. In growing this or any other zinnia we strongly recommend saving the seeds, where the plants are to be bloom if it is at all possible. 2247 STAR DUST. Another brilliant member of the Fantasy Group. STAR DUST received the Award of Merit in the 1937 All-America Selections. 2270 Early Wonder Mixed

2295 Gaillardia Flowered Mixed

2204 POLAR BEAR. Pure snowy white flowers of great size and remarkable texture.

BRIEF CULTURAL NOTES

ZINNIAS: Zinnias are warm weather loving plants and should never be sown until the soil has thoroughly warmed and all danger of any frost has passed. For best results, especially with the smaller flowered, early blooming varieties, we recommend saving the seed where the plants are to flower. The taller growing, large flowered sorts can safely be transplanted, although they will also make a more robust growth and will produce more flowers if they can be sown where the plants are to bloom, and then when the seedlings are 3" or 4" tall, thinned to the proper distance. To induce a thrifty, heavy root system, irrigate your plants rather than sprinkling. Dig a little trench alongside the row and let the water run slowly for several hours so it will seep down deep into the ground and make the food in the soil available for the plant throughout the mass of feeding roots. Always cultivate after each irrigation to conserve moisture. By this method you will have to water Zinnias only once every two weeks or so, whereas if the ground is merely sprinkled, you will have to repeat the sprinkling every other day or so. Irrigation not only gives a stronger, healthier plant, but also saves on your water bill.

ZINNIA LINEARIS

2197 LINEARIS. The most unusual of the new Zinnias is the dwarf variety, Linearis. The single flowers are a lovely shade of golden orange, with a delicate lemon yellow stripe through each petal. It is extremely early blooming, commencing to flower when the plants are about 6 inches tall and keeping on right through the season until the late frosts of autumn. The plants reach a height of 8 to 10 inches and the flowers are produced in great profusion, literally hundreds being open at one time. Linearis is an extremely valuable addition to the list of plants suitable for border or edging use and is excellent for window boxes or in any part of the garden. It will start flowering about 6 weeks after seeds are sown. Pkt. 10c; 3 pkts. 25c.
## WYATT'S
### PERENNIAL FLOWER SEEDS

**Grow Your Own Perennials From Seeds**

Everybody wants perennials—and wants them in generous measure to secure the desired effects in color and charm. If you delay and finally buy plants, the cost mounts high; an attractive perennial border may require several hundred dollars worth of plants. Exactly the same results can be secured with $2.00 or $4.00 worth of seeds! Aside from the money saved it is very fascinating to grow your own plants from seed.

**CULTURE**

No fall flower equals the dahlia in popularity. Plant after the first of May in any average garden soil. About three feet of space is generally needed; some varieties require less. Place tubers flat in holes about six inches deep and fill about half full of soil. Gradually finish filling hole as plant grows. Keep well cultivated. If plants are not pinched after formation of the second pair of leaves, staking is generally necessary. For large flowers leave only one bud to the stem. Dig carefully (do not break root necks) and store in dry sand, sawdust or other similar material in frost-free places—never in water. Roots should be free from excess moisture before storing.

**FERTILIZERS**

For poor and run-down soils turn under liberal applications of well-rotted stable manure several weeks before planting time. A handful of bone meal per hill or a small amount of a well balanced commercial fertilizer thoroughly mixed with the soil at planting time will aid the growth of the young plant. In rich soils no fertilizer should be applied at planting time. When the plants are about twelve inches high, top dress with a handful of good potato or truck fertilizer per hill, not allowing the fertilizer to come closer to the plant than five or six inches. Repeat this when the buds begin to appear and every three or four weeks during the blooming season until about September 15. Scratch the fertilizer in with a rake or cultivator. Do not over-fertilize with strong nitrogenous fertilizers. Moderate fertilization not only produces good flowers but also produces roots which will keep over winter. For soils of fair fertility, a mixed fertilizer made up of high grade materials, containing 3 per cent nitrogen, 7 to 8 per cent phosphoric acid and 5 to 6 per cent potash, can be generally recommended.

F78 ALYCE CLOVER
SENSATIONAL NEW FORAGE CROP
Best Southern Summer Legume for Hay, Pasture, Soil Improvement or Quail Feed; Heat and Drought Resistant

U. S. Department of Agriculture: "Alyce Clover, like Dura Clover, has been released by the Department from Southern Asia (1910), and seems well adapted to the South. Has made a good growth in Louisiana, Mississippi, Texas, Georgia, and Florida. It makes excellent hay, pasture and cover crops. A low spreading, branched, leafy plant, 3 feet tall in thick stands. Cattle are fond of it both green and dry. It is a summer annual, maturing seed in October, and volunteers a good stand the following year. When cut early for hay a second growth will produce a seed crop, 450 to 600 lbs. per acre. Cut hay in early bloom. Raise as soon as drying permits. Dries readily and can be baled the day following harvest. Prefers sandy loams, but has done well on all better grades of general farming lands except very light or wet. Use 200 to 400 lbs. of superphosphate on poor soils. Not sensitive to lime. Plant from spring to July, May or June preferred. Broadcast 10 lbs. of hulled seed per acre on well prepared ground and cover lightly. It is not seriously damaged by any disease or insect."
Prices: Lb. 35c; 2 lbs. 65c, postpaid. Not prepaid, 10 lbs. 25c; 25 lbs. 45c; 100 lbs. or more at 20c lb.

Alfalfa can be sown in either fall or spring. The closer you sow the better the stand will be. Alfalfa tolerates very well drained good loamy land. Alfalfa will not grow on acid soils, and those crops that condition spread a few feet in 50 years of finely ground lime to the acre after plowing and a few weeks before sowing. Cutting should be done after the flowers have been on the ground. For hay 40 lbs. to the acre.

OLIVER FARM EQUIPMENT

OLIVER TRACTOR DISC HARROW

OLIVER TRACTOR DISC HARROW in 20-disc size is made for use with the small size tractor. It is controlled by the operator of the tractor and in this way requires only one man to operate both tractor and harrow. Built especially durable at each wearing point, easily operated and doing the best possible job of discing—that is the story of the construction, the operation and the work of the Oliver NTBH Harrow.

OLIVER SELF DUMP RAKE

THE OLIVER SELF DUMP RAKE is built with a strong rigid frame of hot riveted angle steel. A heavy truss rod runs the entire length of the frame and supports the center of the rake. It is a bridle truss frame that is built to prevent sagging or twisting.

The rake teeth are lifted, and the hay dumped, by a pair of strong lift rods operating from each wheel. The ends of the lift rod are shaped into pawls to fit into the ratchets in the wheel hubs. The large number of ratchet teeth in the wheel hubs cause the rake to dump, the instant pressure is applied to the foot dump pedal. The rake teeth drop to the ground immediately, leaving an unraked strip next to the windrow.

The teeth are made of heat treated high carbon spring steel. They are strong but have sufficient springiness to prevent breakage when they encounter an obstruction.

The wheels are unusually strong. The concave tires are 1 5/8 inches wide and 54 inches in diameter.

OLIVER STALK CUTTER

OLIVER STALK CUTTER is steel built throughout with heavy angle steel frame and equipped with latest type steel wheel with dust-proof boxing, which makes it one of the strongest and most durable machines on the market, one that has had a thorough test under the most exacting conditions, thereby proving its worth.

OLIVER MOWER

THE OLIVER MOWER is a fast cutting, long-lasting machine, in which every part does its share.

The Oliver Mower Frame is strongly built and braced with a solid cross member in the pullman drive end, and braced back again to the tongue. This big Frame holds the driving parts in rigid alignment and provides the solid base that allows the cutter bar the flexibility it needs, while holding it to its straight cutting line.

The Oliver Frame is big, sturdy and solid. It will last and do its work for many years to come.

In the big frame the full length solid axle runs in long roller bearings, spaced far apart, to give the lightest bearing load, which aids in securing the easiest draft.

All gear teeth of the spur gears and also the bevel gears are correctly designed to mesh and secure the greatest power with the least loss to play and friction.

The clutch is of the four jaw dog type, wide on its face to keep down wear, positive and sure in action. It is controlled by a two-pod, double acting foot lever that throws it quickly, either in or out.

No mower has any higher cutting bar speed than the Oliver—many are slower. This higher speed is very essential in cutting wild hay and especially so when mowing road-sides.
